Compaq TCP/IP Services for OpenVMS
Installation and Configuration

Order Number: AA–LU49N–TE

April 2002

This manual explains how to install and configure the Compaq TCP/IP Services for OpenVMS product on your OpenVMS host.

Revision Information: This guide supersedes the Compaq TCP/IP Services for OpenVMS Installation and Configuration manual, Version 5.1

Software Version: Compaq TCP/IP Services for OpenVMS Version 5.3

Operating Systems: OpenVMS Alpha Versions 7.2-2, 7.3
                         OpenVMS VAX Versions 7.2, 7.3

Compaq Computer Corporation
Houston, Texas

**Preface** ................................................................. v

## 1 Preparing to Install and Configure TCP/IP Services

1.1 Understanding the Major Tasks ........................................ 1–1
1.2 Preinstallation Tasks .................................................. 1–1
1.2.1 Inspecting the Distribution Kit .................................. 1–2
1.2.2 Extracting the Release Notes ...................................... 1–2
1.2.3 Backing Up the System Disk and Upgrading OpenVMS ............ 1–2
1.2.4 Registering the License Product Authorization Key ............... 1–3
1.2.5 Checking the Disk Space .......................................... 1–3
1.2.6 Checking the Physical Memory .................................. 1–3
1.2.7 Checking the System Parameters .................................. 1–4
1.2.7.1 Global Pagelets and Global Sections ......................... 1–4
1.2.7.2 Nonpaged Dynamic Pool ...................................... 1–4
1.2.7.3 Interrupt Stack Pages (VAX Only) ........................... 1–5
1.2.7.4 System Page Table Entries Parameter (VAX Only) .......... 1–5
1.2.8 Assigning a User Identification Code ............................. 1–5
1.3 Assembling Configuration Information ............................... 1–6

## 2 Installing TCP/IP Services

2.1 Invoking the Installation Procedure .................................. 2–1
2.2 Stepping Through the Installation Procedure ....................... 2–2
2.3 Postinstallation Tasks ................................................ 2–3

## 3 Configuring TCP/IP Services

3.1 Recommended Order for Configuring TCP/IP Services ............... 3–1
3.2 Automatic Configuration of TCP/IP Services Using DHCP Client .... 3–1
3.3 Running TCP/IP$CONFIG ............................................. 3–2
3.3.1 Converting Existing TCP/IP Services Configuration Files (Upgrade Only) ........................................ 3–2
3.3.2 Creating New TCP/IP Services Configuration Files ............... 3–3
3.3.3 Understanding the Configuration Menus ........................... 3–4
3.3.4 Configuring the Core Environment ................................ 3–5
3.3.4.1 Domain Configuration ........................................ 3–5
3.3.4.2 Interface Configuration ....................................... 3–6
3.3.4.3 Dynamic Routing Configuration ............................... 3–6
3.3.4.4 BIND Resolver Configuration ................................. 3–7
3.3.4.5 Time Zone Configuration ...................................... 3–7
3.3.5 Configuring the Client Environment ............................... 3–8
3.3.6 Configuring the Server Environment ............................... 3–10
3.3.7 Configuring the Optional Components .............................................. 3–11
  3.3.7.1 Configuring and Enabling Kerberos Support ............................ 3–13
3.4 Using TCPIP$CONFIG Option Commands to Bypass TCPIP$CONFIG
   Menus ................................................................................. 3–14
3.5 Making Configuration Changes Take Effect ........................................ 3–15
3.6 Stopping TCP/IP Services Using TCPIP$CONFIG ............................. 3–15
3.7 Starting TCP/IP Services Using TCPIP$CONFIG ............................... 3–16
3.8 Verifying the Configuration ......................................................... 3–17
  3.8.1 Running the IVP from the TCPIP$CONFIG Command Procedure .... 3–18
  3.8.2 Running the IVP from the OpenVMS DCL Prompt ...................... 3–18
  3.8.3 Verifying the TCP/IP Services Internet Configuration ................. 3–18
  3.8.4 Verifying the SNMP Configuration .................................... 3–19
3.9 Additional Configuration Tasks .................................................... 3–20
3.10 Starting and Stopping TCP/IP Services by Command ...................... 3–20
  3.10.1 Automatically Starting and Stopping TCP/IP Services ............... 3–21
  3.10.2 Starting and Stopping TCP/IP Services Manually ................... 3–21
  3.10.3 Starting and Stopping Individual Services ............................. 3–21
  3.10.4 Starting and Stopping User-Written Services......................... 3–22
3.11 Specifying TCP/IP Services as the Transport for DECwindows
   Applications ........................................................................ 3–22

The Compaq TCP/IP Services for OpenVMS product is the Compaq implementation of the TCP/IP networking protocol suite and internet services for OpenVMS Alpha and OpenVMS VAX systems.

TCP/IP Services provides a comprehensive suite of functions and applications that support industry-standard protocols for heterogeneous network communications and resource sharing.

This manual explains how to install and configure the Compaq TCP/IP Services for OpenVMS (TCP/IP Services) networking software on an OpenVMS system. This manual reflects the installation and configuration procedures for Version 5.3 of the TCP/IP Services product. For information about last-minute changes to these procedures, see the Compaq TCP/IP Services for OpenVMS Release Notes.

Intended Audience

This manual is for experienced OpenVMS and UNIX system managers and assumes a working knowledge of OpenVMS system management, TCP/IP networking, and TCP/IP terminology.

Document Structure

This manual contains three chapters and one appendix:

• Chapter 1 explains how to prepare for installing and configuring TCP/IP Services.

• Chapter 2 describes how to install TCP/IP Services on an OpenVMS system using the POLYCENTER Software Installation utility.

• Chapter 3 provides guidelines on how to configure the TCP/IP Services components and services after installation.

• Appendix A provides a sample installation and configuration script as might appear on an OpenVMS system upon which TCP/IP Services has not been installed previously. The script examples in Chapter 3 show what might be seen when you upgrade TCP/IP Services software.

**Reader’s Comments**

Compaq welcomes your comments on this manual. Please send comments to either of the following addresses:

**Internet**  openvmsdoc@compaq.com

**Mail**  Compaq Computer Corporation
OSSG Documentation Group, ZK03-4/U08
110 Spit Brook Rd.
Nashua, NH 03062-2698

**How to Order Additional Documentation**

Visit the following World Wide Web address for information about how to order additional documentation:

http://www.openvms.compaq.com/

**Conventions**

The name TCP/IP Services means both:

- Compaq TCP/IP Services for OpenVMS Alpha
- Compaq TCP/IP Services for OpenVMS VAX

The name UNIX refers to the Compaq Tru64 UNIX operating system.

The following conventions are used in this manual. In addition, please note that all IP addresses are fictitious.

Ctrl/x  A sequence such as Ctrl/x indicates that you must hold down the key labeled Ctrl while you press another key or a pointing device button.
A sequence such as PF1 x indicates that you must first press and release the key labeled PF1 and then press and release another key or a pointing device button.

In examples, a key name enclosed in a box indicates that you press a key on the keyboard. (In text, a key name is not enclosed in a box.)

In the HTML version of this document, this convention appears as brackets, rather than a box.

A horizontal ellipsis in examples indicates one of the following possibilities:

- Additional optional arguments in a statement have been omitted.
- The preceding item or items can be repeated one or more times.
- Additional parameters, values, or other information can be entered.

A vertical ellipsis indicates the omission of items from a code example or command format; the items are omitted because they are not important to the topic being discussed.

In command format descriptions, parentheses indicate that you must enclose choices in parentheses if you specify more than one.

In command format descriptions, brackets indicate optional choices. You can choose one or more items or no items. Do not type the brackets on the command line. However, you must include the brackets in the syntax for OpenVMS directory specifications and for a substring specification in an assignment statement.

In command format descriptions, vertical bars separate choices within brackets or braces. Within brackets, the choices are optional; within braces, at least one choice is required. Do not type the vertical bars on the command line.

In command format descriptions, braces indicate required choices; you must choose at least one of the items listed. Do not type the braces on the command line.

This typeface represents the introduction of a new term. It also represents the name of an argument, an attribute, or a reason.

Italic text indicates important information, complete titles of manuals, or variables. Variables include information that varies in system output (Internal error number, in command lines /PRODUCER=name), and in command parameters in text (where dd represents the predefined code for the device type).

UPPERCASE TEXT Uppercase text indicates a command, the name of a routine, the name of a file, or the abbreviation for a system privilege.

Monospace text Monospace type indicates code examples and interactive screen displays.

In the C programming language, monospace type in text identifies the following elements: keywords, the names of independently compiled external functions and files, syntax summaries, and references to variables or identifiers introduced in an example.
- A hyphen at the end of a command format description, command line, or code line indicates that the command or statement continues on the following line.

numbers All numbers in text are assumed to be decimal unless otherwise noted. Nondecimal radices—binary, octal, or hexadecimal—are explicitly indicated.
Preparing to Install and Configure TCP/IP Services

This chapter explains how to prepare for installing and configuring Compaq TCP/IP Services for OpenVMS software.

1.1 Understanding the Major Tasks

Installing the TCP/IP Services software takes just a few minutes to complete. You can install the software during the OpenVMS operating system installation procedure or as a layered product.

After you install TCP/IP Services, you need to enable the components and verify the configuration through the menu-driven TCPIP$CONFIG configuration procedure. This step may take about 15 minutes to complete.

Table 1–1 lists the major tasks involved in installing and configuring TCP/IP Services and the sections that describe these tasks.

Table 1–1 Major Tasks: Installing and Configuring

<td>Section 1.2.8</td>
</tr>
<tr>
<td>8</td>
<td>Assemble information for configuration.</td>
<td>Section 1.3</td>
</tr>
</tbody>
</table>

1.2.1 Inspecting the Distribution Kit

Make sure you have a complete software distribution kit. If you have the OpenVMS consolidated distribution CD–ROM kit, check the CD master index for the kit location. If you have an individual CD–ROM, supply the device name (such as DKA)n for the media when you issue the command to install TCP/IP Services.

Check that the kit contains everything listed on the Bill of Materials (BOM). If anything is missing or damaged, contact your Compaq representative.

1.2.2 Extracting the Release Notes

The Compaq TCP/IP Services for OpenVMS Release Notes document contains important information you should know before you install the product.

You can have the POLYCENTER Software Installation utility extract the release notes as either a text file or a PostScript file. To extract the release notes as a text file, enter the following POLYCENTER Software Installation utility command:

```
$ PRODUCT EXTRACT RELEASE_NOTES TCPIP/SELECT=TCPIP053.RELEASE_NOTES
```

To extract the release notes as a PostScript file, enter the following:

```
$ PRODUCT EXTRACT RELEASE_NOTES TCPIP/SELECT=TCPIP053_RELEASE_NOTES.PS
```

1.2.3 Backing Up the System Disk and Upgrading OpenVMS

Before you install TCP/IP Services, Compaq recommends that you back up the system disk using the backup procedures established at your site. After the backup operation is complete, you should upgrade the OpenVMS operating system, if applicable.

For information about backing up a system disk, see the OpenVMS System Manager’s Manual: Essentials.

For information about how to upgrade OpenVMS, refer to the appropriate OpenVMS upgrade and installation manual.
1.2.4 Registering the License Product Authorization Key
Before you install TCP/IP Services on a newly licensed node or cluster, you must register a License Product Authorization Key (PAK) using the OpenVMS License Management Facility (LMF). Without a PAK, you can use only DECwindows TCP/IP Transport software.

If you are upgrading TCP/IP Services on a node or cluster that is licensed for this software, you have already completed the License PAK registration requirements.

If you ordered the license and the media together, the PAK is included with your distribution kit. Otherwise, the PAK is shipped separately to the location specified on the license order.

If you are also installing prerequisite or optional software, review the PAK status and install the PAKs for any prerequisite or optional software before you install TCP/IP Services.

To register a license, log in to the SYSTEM account and do one of the following:
• Run the SYS$UPDATE:VMSLICENSE.COM file and enter the data from your License PAK.
• At the DCL prompt, enter the LICENSE REGISTER command and the appropriate qualifiers.

You must register a license for each node in an OpenVMS Cluster.

For complete information about LMF, see the OpenVMS License Management Utility Manual.

1.2.5 Checking the Disk Space
Make sure your system meets the following disk space requirements:

<table>
<thead>
<tr>
<th>System</th>
<th>Minimum Block Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenVMS Alpha</td>
<td>125,000</td>
</tr>
<tr>
<td>OpenVMS VAX</td>
<td>70,000</td>
</tr>
</tbody>
</table>

The actual disk space needed varies depending on the system environment, configuration, and software options.

To find out how many free blocks exist on the system disk, enter:

$ SHOW DEVICE SYS$SYSDEVICE

1.2.6 Checking the Physical Memory
Make sure the system meets the following physical memory requirements:

<table>
<thead>
<tr>
<th>System</th>
<th>Minimum Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenVMS Alpha</td>
<td>32 MB</td>
</tr>
<tr>
<td>OpenVMS VAX</td>
<td>24 MB</td>
</tr>
</tbody>
</table>

To check the memory, enter:

$ SHOW MEMORY/FULL
Preparing to Install and Configure TCP/IP Services

1.2 Preinstallation Tasks

1.2.7 Checking the System Parameters

Most systems have adequate system resources readily available to include the TCP/IP Services software. However, you should check the system parameters outlined in the following sections. Make any necessary changes to the MODPARAMS.DAT file, then run AUTOGEN, and reboot your system.

1.2.7.1 Global Pagelets and Global Sections

The TCP/IP Services software requires 65 global sections and 8100 global pagelets.

To check the number of available global pagelets and global sections, enter WRITE commands with the F$GETSYI lexical functions. The following is an example from an OpenVMS Alpha system:

```
$ WRITE SYS$OUTPUT F$GETSYI("FREE_GBLPAGES") 143576
$ WRITE SYS$OUTPUT F$GETSYI("FREE_GBLSECTS") 249
```

To increase the global pagelets and global sections, add statements to the SYS$SYSTEM:MODPARAMS.DAT file that increase the values of the system parameters GBLPAGES and GBLSECTIONS, as in the following example:

```
ADD_GBLPAGES = 7500
ADD_GBLSECTIONS = 75
```

1.2.7.2 Nonpaged Dynamic Pool

Add at least 500,000 bytes of nonpaged dynamic pool for the software, as follows:

1. Log in to the SYSTEM account.
2. Identify the amount of additional nonpaged pool your system requires. Use the estimated value of 500,000 bytes, and then increase the value depending on the maximum amount of sockets you have. For each socket, allow a value of 2,000 bytes.

```
Note

On a system that uses FDDI, the default sizes for the TCP/IP socket buffer quotas are increased automatically. This increases throughput across the FDDI for local TCP connections.
```

3. Refer to the following example, and then edit MODPARAMS.DAT to reflect the appropriate value for the NPAGEDYN and NPAGEVIR parameters:

```
! Add nonpaged pool for Compaq TCP/IP Services for OpenVMS.
!
ADD_NPAGEDYN=500000
ADD_NPAGEVIR=500000
```

For more information about nonpaged dynamic pool, see the OpenVMS System Manager’s Manual: Essentials.
1.2.7.3 Interrupt Stack Pages (VAX Only)

If you are using PATHWORKS Internet Protocol (PWIP) on an OpenVMS VAX system, you should increase the number of interrupt stack pages (INTSTKPAGES) to 12 or more to help eliminate system startup warnings and failures. For information about the PATHWORKS for OpenVMS (Advanced Server), see the PATHWORKS documentation.

To increase the number of interrupt stack pages, add a statement to the MODPARAMS.DAT file that increases the value of the INTSTKPAGES system parameter, as in the following example:

```
ADD_INTSTKPAGES = 12
```

1.2.7.4 System Page Table Entries Parameter (VAX Only)

On VAX systems, make sure the AUTOGEN parameter SPTREQ is set to at least 6000. To check the minimum SPTREQ value, run SYSMAN as follows:

```
$ RUN SYS$SYSTEM:SYSMAN
SYSMAN> parameter show sptreq
%SYSMAN, a USE ACTIVE has been defaulted on node VMSVAX
Node VMSVAX: Parameters in use: ACTIVE
Parameter Name     Current  Default  Minimum  Maximum  Unit  Dynamic
------------------ -------- -------- -------- -------- ---- --------
SPTREQ             8000  3900      3000      -1  Pages
SYSMAN>
```

To modify the minimum SPTREQ, run the AUTOGEN command procedure as described in the OpenVMS System Management Utilities Reference Manual: A-L. Modify the minimum SPTREQ value as follows:

```
MIN_SPTREQ = 6000
```

1.2.8 Assigning a User Identification Code

An OpenVMS user or group of users is identified by a unique, assigned user identification code (UIC) in the format [group,member], where group and member are numeric, alphanumerical, or alphabetic characters. For example, a UIC can be either [306,210], [GROUP1, JONES], or simply JONES. The UIC is linked to a system-defined rights database that determines user and group privileges.

The TCPIP$CONFIG configuration procedure uses a group UIC to create accounts for components. If a user-specified UIC is not in place from a previous configuration, the procedure creates the following UIC group numbers:

<table>
<thead>
<tr>
<th>Default UIC Group Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3655</td>
<td>The default UIC group number for service accounts. If this is an initial product configuration but the procedure detects that number 3655 is in use, TCPIP$CONFIG prompts you for a new UIC group number.</td>
</tr>
<tr>
<td>3375</td>
<td>The default UIC group number for the TCPIP$NOBODY user account.</td>
</tr>
<tr>
<td>3376</td>
<td>The default UIC group number for the ANONYMOUS account.</td>
</tr>
</tbody>
</table>

Before you assign a new group UIC, check that the number you chose is not already in use by entering the following commands:
Preparing to Install and Configure TCP/IP Services

1.2 Preinstallation Tasks

$ RUN SYS$SYSTEM:AUTHORIZE
UAP> SHOW /BRIEF [your-group-number, *]
UAP> SHOW /IDENTIFIER /VALUE=UIC: [your-group-number, *]

To force TCPIP$CONFIG to allow you to specify a new UIC group number, assign the value TRUE to the logical name TCPIP$ASK_GROUP_UIC, as in the following example. When you configure TCP/IP Services, TCPIP$CONFIG prompts you for the group UIC.

$ DEFINE TCPIP$ASK_GROUP_UIC TRUE

1.3 Assembling Configuration Information

Use the worksheet in Table 1–3 to assemble configuration information.

If you are configuring TCP/IP Services on the system for the first time, the TCPIP$CONFIG procedure prompts you for the information listed in Table 1–3. If you are reconfiguring after a product upgrade, the procedure uses the previous configuration information as the default for the new configuration.

For information to help you answer the questions on the configuration worksheet, see appropriate chapters in the Compaq TCP/IP Services for OpenVMS Management guide.
<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the system's host name (for example, MYNODE)?</td>
<td></td>
</tr>
<tr>
<td>What is the system's Internet domain name (for example, widgets.com)?</td>
<td></td>
</tr>
<tr>
<td>Do you plan to have your IP interface under control of the DHCP client? If so, the next items on this worksheet (the system's addresses and masks, and the system's network interface), might be configured automatically by the DHCP server, in which case you do not need to specify them. Ask your network manager for details.</td>
<td></td>
</tr>
<tr>
<td>What are the system's addresses and masks?¹</td>
<td></td>
</tr>
<tr>
<td>* IP address (for example, 19.112.139.14)</td>
<td></td>
</tr>
<tr>
<td>* Subnet (network mask) address (for example, 255.0.0.0)</td>
<td></td>
</tr>
<tr>
<td>* Broadcast address (for example, 19.255.255.255)</td>
<td></td>
</tr>
<tr>
<td>What is the system's network interface (for example, WE0)?¹</td>
<td></td>
</tr>
<tr>
<td>What is the group UIC for TCP/IP Services (see Section 1.2.8)? For example, [GROUP1,ONE5].</td>
<td></td>
</tr>
<tr>
<td>Which type of routing is appropriate for the network, Static or Dynamic?</td>
<td></td>
</tr>
<tr>
<td>Static — For simple networks where routes do not change</td>
<td></td>
</tr>
<tr>
<td>If static, enter the default gateway's host name and address (for example, GATWY1; 19.112.0.65).</td>
<td></td>
</tr>
<tr>
<td>Dynamic — For complex networks where flexibility is required</td>
<td></td>
</tr>
<tr>
<td>If dynamic, you must specify either ROUTED or GATED routing.</td>
<td></td>
</tr>
<tr>
<td>Do you plan to enable the BIND resolver? If so:</td>
<td></td>
</tr>
<tr>
<td>* What is the name of the BIND server you want the resolver to use (for example, MAINSV)?</td>
<td></td>
</tr>
<tr>
<td>* What is the IP address of the BIND server (for example, 19.112.139.10)?</td>
<td></td>
</tr>
<tr>
<td>* What is the domain name (for example, mainsv.widgets.com)?</td>
<td></td>
</tr>
</tbody>
</table>

¹If the IP interface runs under control of the DHCP client, this information might be configured automatically. Check with your network manager. For more information, see the DHCP client documentation.

</table>
This chapter explains how to install the Compaq TCP/IP Services for OpenVMS software as a layered product using the POLYCENTER Software Installation utility. The instructions are appropriate for an initial installation or an upgrade.

For information about how to install the product directly from the OpenVMS Alpha CD-ROM menu, refer to the OpenVMS Alpha Upgrade and Installation Manual.

For information about the POLYCENTER Software Installation utility, refer to the OpenVMS System Manager’s Manual: Essentials.

### 2.1 Invoking the Installation Procedure

When you have completed the recommended preinstallation tasks outlined in Chapter 1 and have read the release notes (Section 1.2.2), you are ready to upgrade or install TCP/IP Services.

During a product upgrade, existing configuration files are preserved in case you want to use them when you configure this version of the software.

To install the TCP/IP Services software on an OpenVMS VAX or Alpha system, proceed as follows:

1. Log in to the SYSTEM account.
2. Check to make sure that other users are not logged in to the system.
3. Edit the SYS$STARTUP:SYSTARTUP_VMS.COM file and check to see if the command @SYS$STARTUP:UCX$STARTUP is defined. If this command is defined, edit the line, replacing the command definition with @SYS$STARTUP:TCPIP$STARTUP so that the current version of the product starts automatically when the system starts up.
4. If a previous version of the software is installed on the system, shut it down. Enter one of the following commands:

<table>
<thead>
<tr>
<th>Software Version</th>
<th>Use This Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version 4.x</td>
<td>@SYS$MANAGER:UCX$SHUTDOWN.COM</td>
</tr>
<tr>
<td>Version 5.x</td>
<td>@SYS$STARTUP:TCPIP$SHUTDOWN.COM</td>
</tr>
</tbody>
</table>

5. Compaq recommends that you log the installation procedure. If you have DECnet configured on your system, you can create a log of the installation procedure by entering the following command and then log in to the system account again:
Installing TCP/IP Services

2.1 Invoking the Installation Procedure

$ SET HOST 0/LOG=file-specification

In this command, file-specification is the name of the file to which you want the log written. The log file is written to the current directory.

6. Start the POLYCENTER Software Installation utility by entering the PRODUCT INSTALL command with the directory path appropriate for your system. For example:

$ PRODUCT INSTALL TCPIP /SOURCE=directory-path

In this command, directory-path specifies the disk and directory name for the source drive that holds the TCP/IP Services kit. For example, /SOURCE=DKA400:[TCPIPAXP053].

If you do not specify the source qualifier, the POLYCENTER Software Installation utility searches the location defined by the logical name PCSI$SOURCE. If not defined, the utility searches the current default directory.

2.2 Stepping Through the Installation Procedure

After you invoke the installation procedure, you are prompted for information. Example 2–1 shows a sample installation on an OpenVMS Alpha system that has an earlier version of TCP/IP Services installed on it. Additional explanatory information follows each portion of the script. For a sample installation on a system on which the product has never been installed, see Appendix A.

The actual installation output that is displayed on your system might vary, depending on your current configuration.

Note

To stop the installation at any time, press Ctrl/Y. The installation procedure deletes any files that were created, then exits.

The symbols xx in the following example and elsewhere in this document represent the product's two-digit update version number.

Example 2–1 TCP/IP Services Installation: Sample POLYCENTER Software Installation Utility Procedure

1 - DEC AXPVMS TCPIP V5.3-xx Layered Product
2 - DEC AXPVMS TCPIP V5.1-15 Layered Product
3 - DEC AXPVMS TCPIP V5.0-11 Layered Product
4 - All products listed above
5 - Exit

Choose one or more items from the menu separated by commas: 1

The menu that is displayed initially includes the latest TCP/IP Services product and any versions of the product that are in place on the system. Install the latest version (option 1).

The following product has been selected:
DEC AXPVMS TCPIP V5.3-xx Layered Product

Do you want to continue? [YES]
Press Return to continue with the installation procedure.

Configuration phase starting ...

You will be asked to choose options, if any, for each selected product and for any products that may be installed to satisfy software dependency requirements.

DEC AXPVMS TCPIP V5.3-xx: Compaq TCP/IP Services for OpenVMS.

Copyright 2002 Compaq Information Technologies Group, L.P.

Compaq Computer Corporation

Compaq TCP/IP Services for OpenVMS offers several license options.

Do you want the defaults for all options? [YES] Return

Answer YES to choose the POLYCENTER Software Installation utility defaults for the options or NO to choose other options.

Do you want to review the options? [NO] Return

Answer YES to review the POLYCENTER Software Installation utility options. In this example, the options are not reviewed.

If you select YES, the options are displayed and you are asked whether you are satisfied with the options. Press Return to accept the options as listed, or answer NO to change the options.

Execution phase starting ...

The following product will be installed to destination:
DEC AXPVMS TCPIP V5.3-xx DISK$ALPHASYS:[VMS$COMMON.]

The following product will be removed from destination:
DEC AXPVMS TCPIP V5.1-15 DISK$ALPHASYS:[VMS$COMMON.]

Portion done: 0%...10%...20%...30%...40%...50%...60%...70%...80%...90%

The following message appears only if an earlier version of TCP/IP Services was configured on your system. A similar message, verifying the product name and version, appears if you are installing for the first time.

%PCSI-I-PRCOUTPUT, output from subprocess follows ...
% TCPIP-W-PCSI_INSTALL
% - BG device exists.
% To use the version of Compaq TCP/IP Services that was just installed,
% system must be rebooted.
%
Portion done: 100%

The following product has been installed:
DEC AXPVMS TCPIP V5.3-xx Layered Product
The following product has been removed:
DEC AXPVMS TCPIP V5.1-15 Layered Product
DEC AXPVMS TCPIP V5.3-xx: Compaq TCP/IP Services for OpenVMS.

Check the release notes for current status of the product.

2.3 Postinstallation Tasks

After the installation completes, perform the following steps:
1. Optionally, you can:
   - Read the Compaq TCP/IP Services for OpenVMS Release Notes on line or
     print the file from SYS$HELP:TCPIP053_RELEASE_NOTES.PS or
     SYS$HELP:TCPIP053.RELEASE_NOTES.
   - Display a list of the TCP/IP Services files that were installed. Enter the
     following command:

     $ PRODUCT LIST TCPIP /SOURCE=directory-path

     In this command, directory-path specifies the disk and directory name
     for the source drive that holds the TCP/IP Services kit (for example,
     /SOURCE=DKA400:[TCPIPAXP053]). If you do not specify the source
     qualifier, the POLYCENTER Software Installation utility searches the
     location defined by the logical name PCSI$SOURCE. If not defined, the
     utility searches the current default directory.

2. If you had a previous version of TCP/IP Services configured on your system
   and the software was previously started, reboot your system for the new
   TCP/IP Services software to take effect. Proceed to step 4.

   **Important**

   Do not delete any files that remain from the previous version of the
   product. Many of these files are used by TCPIP$CONFIG for converting
   your existing configuration to the new configuration (described in
   Chapter 3).

3. Log out of the SYSTEM account, and then log back in to the SYSTEM account
   to establish the TCPIP command environment.

4. Proceed to Chapter 3 to configure TCP/IP Services.
Chapter 3

Configuring TCP/IP Services

After you install Compaq TCP/IP Services for OpenVMS, you need to enable the components and characteristics you require for your particular system using the menu-driven TCPIP$CONFIG procedure.

This chapter explains the TCPIP$CONFIG menus, provides sample installation output, and summarizes additional configuration and setup tasks.

3.1 Recommended Order for Configuring TCP/IP Services

Table 3-1 lists the tasks involved in configuring the TCP/IP Services components and functionality, and the sections that describe these tasks.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Described in...</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Assemble system information to prepare for running TCPIP$CONFIG.</td>
<td>Section 1.3</td>
</tr>
<tr>
<td>2</td>
<td>Run TCPIP$CONFIG. If you have a TCP/IP Services V4.x configuration on your system, answer prompts to convert existing databases or create new ones.</td>
<td>Section 3.3</td>
</tr>
<tr>
<td>3</td>
<td>If preferred, have TCP/IP Services software configured automatically by a DHCP server.</td>
<td>Section 3.2</td>
</tr>
<tr>
<td>4</td>
<td>Manually configure the major components and functionality using TCPIP$CONFIG.</td>
<td>Section 3.3.4</td>

<tr>
<td>5</td>
<td>Configure the optional components using TCPIP$CONFIG, as applicable.</td>
<td>Section 3.3.7</td>
</tr>
<tr>
<td>6</td>
<td>Start TCP/IP Services.</td>
<td>Section 3.5</td>
</tr>
<tr>
<td>7</td>
<td>Verify the configuration.</td>
<td>Section 3.8</td>
</tr>
<tr>
<td>8</td>
<td>Complete additional configuration tasks, as appropriate.</td>
<td>Section 3.9</td>
</tr>
</tbody>
</table>

3.2 Automatic Configuration of TCP/IP Services Using DHCP Client

TCP/IP Services Version 5.3 supports the DHCP client, which allows you to have your system configured automatically by a DHCP server. You can achieve this in one of two ways:

- If TCP/IP Services has never been configured on your system, you can run the TCP/IP Services startup procedure, SYS$MANAGER:TCPIP$STARTUP.COM. The startup procedure detects the fact that the TCP/IP Services software has not been configured and asks whether you want the DHCP client to configure the host for you. Answer YES.
Configuring TCP/IP Services

3.2 Automatic Configuration of TCP/IP Services Using DHCP Client

The startup procedure invokes TCPIP$CONFIG, which sets up the environment for the DHCP client and designates any unconfigured interfaces to be under DHCP client control. The procedure enables the following set of services automatically:

- FTP client
- TELNET client
- TELNET server
- SMTP

For more information about DHCP, see the Compaq TCP/IP Services for OpenVMS Management manual.

- Run TCPIP$CONFIG. Choose option 2 from the Core Environment Configuration menu to configure the Internet interface, and then choose option 2 from the Interface Configuration menu:

  Configuration options:
  1 - Configure interface manually  (Current default)
  2 - Let DHCP configure interface

  You can also use TCPIP$CONFIG to configure additional services and parameters, as needed.

3.3 Running TCPIP$CONFIG

The TCPIP$CONFIG procedure displays menus from which you do the following:

- Make selections that enable components for your system. To select the default, press the Return key.
- Start or stop TCP/IP Services software.
- Verify the configuration.

To get started, enter:

$ @SYS$MANAGER:TCPIP$CONFIG

3.3.1 Converting Existing TCP/IP Services Configuration Files (Upgrade Only)

If you have a TCP/IP Services for OpenVMS (UCX) configuration in place from a V4.x version of the product, and you have never configured a V5.x product on the system, the procedure begins by asking you whether to convert the old TCP/IP Services configuration files:

Convert the old configuration files [Y]

Unless you respond NO to the prompt, the procedure converts existing configuration files to new configuration files.

If you have already configured this product, the procedure indicates that no new configuration files are being created:

Checking TCP/IP Services for OpenVMS configuration database files.
No new database files were created.
The following sample output shows the start of the TCPIP$CONFIG procedure and a portion of the conversion of a previous configuration:

TCP/IP Network Configuration Procedure
This procedure helps you define the parameters required to run Compaq TCP/IP Services for OpenVMS on this system.

NOTE:
TCP/IP has been previously configured from an earlier version of this product. You can avoid a complete reconfiguration of TCP/IP by allowing this procedure to automatically convert the old configuration files. If you choose not to do this now, you will not be asked again. At the end of the conversion you will be able to further modify your configuration.

Convert the old configuration files [Y]:  [Return]
Preparing files for conversion...
  UCX$SERVICE.DAT --> TCPIP$SERVICE.DAT
  UCX$HOST.DAT --> TCPIP$HOST.DAT
  UCX$NETWORK.DAT --> TCPIP$NETWORK.DAT
  UCX$ROUTE.DAT --> TCPIP$ROUTE.DAT
  UCX$PROXY.DAT --> TCPIP$PROXY.DAT
  UCX$CONFIGURATION.DAT --> TCPIP$CONFIGURATION.DAT
  UCX$EXPORT.DAT --> TCPIP$EXPORT.DAT
  UCX$PRINTCAP.DAT --> TCPIP$PRINTCAP.DAT
  No new database files were created.

FTP SERVER Configuration
LPD SERVER Configuration
Service is not defined in the SYSUAF.
Nonprivileged user access is not enabled.

By default, Compaq TCP/IP Services for OpenVMS configures LPD such that nonprivileged users cannot modify queue entries.

Creating TCPIP$AUX identifier with a value of 3655

Compaq TCP/IP Services for OpenVMS supports Line Printer Daemon Protocol (see RFC 1179).

LPD requires the following:
- Name of the local queue
- Name of the remote queue
- Name of the remote host
- Spooling directory for the local queue

To add or delete printers in the TCPIP PRINTCAP database, use the $RUN SYSSSYSTEM:TCP/IP$LPRESETUP command.

3.3.2 Creating New TCP/IP Services Configuration Files
If you do not have an existing TCP/IP Services configuration in place from a previous version of the product, the procedure begins by creating configuration database files, as shown in the following sample output:

TCP/IP Network Configuration Procedure
This procedure helps you define the parameters required to run Compaq TCP/IP Services for OpenVMS on this system.

Checking TCP/IP Services for OpenVMS configuration database files.
Configuring TCP/IP Services

3.3 Running TCPIP$CONFIG

Creating SYS$COMMON:[SYSEXE]TCPIP$SERVICE.DAT
Creating SYS$COMMON:[SYSEXE]TCPIP$HOST.DAT
Creating SYS$COMMON:[SYSEXE]TCPIP$NETWORK.DAT
Creating SYS$COMMON:[SYSEXE]TCPIP$ROUTE.DAT
Creating SYS$COMMON:[SYSEXE]TCPIP$PROXY.DAT
Creating SYS$COMMON:[SYSEXE]TCPIP$CONFIGURATION.DAT
Creating TCPIP$ETC:SYSCONFIGTAB.DAT

Compaq TCP/IP Services for OpenVMS requires a definition for at least one interface. There are no interfaces defined on this system.

Please select the Interface option from the Core Environment Menu.

3.3.3 Understanding the Configuration Menus

After the configuration files are converted or created, the Main Configuration menu is displayed:

Compaq TCP/IP Services for OpenVMS Configuration Menu

Configuration options:
1 - Core environment
2 - Client components
3 - Server components
4 - Optional components
5 - Shutdown Compaq TCP/IP Services for OpenVMS
6 - Startup Compaq TCP/IP Services for OpenVMS
7 - Run tests
A - Configure options 1 - 4
[E] - Exit configuration procedure

Enter configuration option:

The options are as follows:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Core environment</td>
</tr>
<tr>
<td>2</td>
<td>Client components</td>
</tr>
<tr>
<td>3</td>
<td>Server components</td>
</tr>
<tr>
<td>4</td>
<td>Optional components</td>
</tr>
<tr>
<td>5</td>
<td>Shutdown TCP/IP Services for OpenVMS</td>
</tr>
<tr>
<td>6</td>
<td>Startup TCP/IP Services for OpenVMS</td>
</tr>
<tr>
<td>7</td>
<td>Run tests</td>
</tr>
<tr>
<td>A</td>
<td>Configure options 1 - 4</td>
</tr>
<tr>
<td>E</td>
<td>Exit the configuration procedure</td>
</tr>
</tbody>
</table>

If you do not have experience with the TCP/IP Services product, you should use the configuration menus. However, if you have experience configuring the
software and want to bypass the menus, you can add one or more command parameters when you run TCPIP$CONFIG. For information about the command parameters, see Section 3.4.

3.3.4 Configuring the Core Environment

To display the Core Environment Configuration menu, choose option 1 (Core environment) from the Main Configuration menu. If you chose option A from the Main Configuration menu to configure all the TCP/IP Services components, the Core Environment Configuration menu is displayed first. The sample output in the following sections show the progression of the procedure when you choose option A.

You are required to configure the Domain, Interfaces, and Routing components; BIND Resolver and Time Zone are optional.

Note

Use the Interfaces menu (option 2) to set up an interface under control of the DHCP client. If you mark a DHCP client interface as primary, you might not need to set up the other Core Environment components. Ask your network manager whether these components are configured by DHCP. For more information, see the DHCP client documentation.

Compaq TCP/IP Services for OpenVMS Core Environment Configuration Menu

Configuration options:

1 - Domain
2 - Interfaces
3 - Routing
4 - BIND Resolver
5 - Time Zone
A - Configure options 1 - 5
[E] - Exit menu

Enter configuration option: A

The following sections include sample output for the core environment components. The samples reflect a TCP/IP Services product configuration for a system on which other TCP/IP Services configurations are in place. The output varies for a new TCP/IP Services installation (see Appendix A).

Enter your responses to the menu questions using the information from your configuration planning worksheet (Section 1.3).

3.3.4.1 Domain Configuration

The following is sample output for configuring the domain:

DOMAIN Configuration

Enter Internet domain [budget.acme.com]: widgets.com
3.3.4.2 Interface Configuration

The following is sample output for configuring the Internet interface:

```
INTERFACE Configuration

The Ethernet device(s) on your system are: EWA0:

Start of configuration questions for Internet interface WE0.
WE0 is the Ethernet device EWA0:

Interface: WE0
IP_Addr: 10.10.2.2  NETWRK: 255.255.255.0  BRDCST: 10.10.2.255
C_Addr:  C_NETWRK:  C_BRDCST:

Flags:  Receive buffer:  0

Compaq TCP/IP Services for OpenVMS Interface WE0 Reconfiguration Menu

Reconfiguration options:
1 - Configure interface manually (Current default)
2 - Let DHCP configure interface
 [E] - Exit menu (Do not reconfigure interface WE0)

Enter configuration option: Return

In this example, no changes are made to the interface.
```

3.3.4.3 Dynamic Routing Configuration

The following is sample output for configuring dynamic routing:
DYNAMIC ROUTING Configuration

Dynamic routing has not been configured.

You may configure dynamic ROUTED or GATED routing. You cannot enable both at the same time. If you want to change from one to the other, you must disable the current routing first, then enable the desired routing.

If you enable dynamic ROUTED routing, this host will use the Routing Information Protocol (RIP) - Version 1 to listen for all dynamic routing information coming from other hosts to update its internal routing tables. It will also supply its own Internet addresses to routing requests made from remote hosts.

If you enable dynamic GATED routing, you will be able to configure this host to use any combination of the following routing protocols to exchange dynamic routing information with other hosts on the network:

- Routing Information Protocol (RIP) - Version 1 & 2
- Router Discovery Protocol (RDISC)
- Open Shortest Path First (OSPF)
- Exterior Gateway Protocol (EGP)
- Border Gateway Protocol (BGP-4)
- Static routes

* Do you want to configure dynamic ROUTED or GATED routing [NO]: YES

* Do you want to enable GATED routing configuration [NO]:

ROUTED option

If you enable the ‘supply’ option of dynamic routing, this host will supply dynamic routing information to other hosts on the network whether it is acting as an internetwork gateway or not.

* Do you want this host to supply its dynamic routing information [NO]:

3.3.4.4 BIND Resolver Configuration

The following is sample output for configuring the BIND resolver:

A BIND resolver has already been configured.

BIND Resolver Configuration

- Transport: UDP
- Domain: budget.acme.com
- Retry: 4
- Timeout: 4
- Servers: island.budget.acme.com
- Path: No values defined

* Do you want to reconfigure BIND [NO]:

In this example, no changes are made to the BIND resolver.

3.3.4.5 Time Zone Configuration

The following is sample output for configuring the time zone:
3.3 Running TCPIP$CONFIG

TIME ZONE Configuration

TCPIP uses timezone information provided by the OpenVMS Operating System. No additional timezone configuration is needed for TCPIP when the operating system is configured correctly.

This section verifies the current OpenVMS timezone configuration. A warning message (TCPIP-W-) indicates that corrective action should be taken. TCPIP will appear to operate but components may display either the wrong time or a time inconsistent with other applications.

%TCPIP-I-INFO, Logical name SYS$TIMEZONE_RULE found.
-TCPIP-I-INFO, Software for automatic Summer/Winter time (TDF) change
-TCPIP-I-INFO, is present.
-TCPIP-I-INFO, Further action to ensure TDF change is not necessary.

%TCPIP-I-NORMAL, timezone information verified

Press Return to continue ...

After you configure the core environment, press Return or choose option E to exit from the Core Environment menu. If you chose option A from the Main Configuration menu to configure all the TCP/IP Services components, the Client Components Configuration menu displays next; otherwise, the procedure returns to the the Main Configuration menu.

3.3.5 Configuring the Client Environment

To display the Client Components Configuration menu, choose option 2 (Client components) from the Main Configuration menu. If you chose option A from the Main Configuration menu to configure all the TCP/IP Services components, the Client Components Configuration menu displays automatically after you finish configuring the core environment components.

From the Client Components Configuration menu, choose option A to configure all the client components. Alternatively, you can configure one client component at a time. The sample output in the following sections show the progression of the procedure when you choose option A.

Compaq TCP/IP Services for OpenVMS Client Components Configuration Menu

Configuration options:

1 - FTP Enabled Stopped
2 - NFS Client Enabled Stopped
3 - REXEC and RSH Enabled Stopped
4 - RLOGIN Enabled Stopped
5 - SMTP Enabled Stopped
6 - TELNET Enabled Stopped
7 - DHCP Disabled Stopped
8 - Telnetsym Disabled Stopped
A - Configure options 1 - 8
[E] - Exit menu

Note that the sample Client Components Configuration menu shows most components enabled and all of them stopped. Components are enabled if they have been enabled in the TCP/IP Services configuration database (TCPIP$CONFIGURATION.DAT). The enabled services are started the next time TCP/IP Services is started. You can also start (or stop) a specific component, without having to restart TCP/IP Services, by choosing the “Start service” option from that component's configuration menu. In addition, you can use command procedures to start or stop a specific component, as explained in Section 3.10.3.
The initial status of the components depends on whether you have other TCP/IP Services installations in place on the system, and whether the software or individual components have been started. On a new system, all the components would be disabled (the default). The status of components is also affected by the selections you made from the Core Environment menu.

To minimize resource consumption, enable and start only those components that you are sure to use. Disable those you do not plan to use.

To configure all the client components, choose option A.

The following is an example of the output for configuring an FTP client. The configuration output for other clients might vary. Note that after you configure a client (such as FTP) that has an associated server, the configuration prompts you about whether to configure the corresponding server.

Enter configuration option: 1
FTP CLIENT Configuration
Service is enabled on specific node.
Service is stopped.

FTP CLIENT configuration options:
1 - Disable service on this node
2 - Start service on this node
[E] - Exit FTP_CLIENT configuration

Enter configuration option: 1
The FTP SERVER is enabled.
* Do you want to configure the FTP SERVER [NO] ?

In the preceding example, the FTP client was originally enabled, and you chose option 1 to disable it. The following example shows the configuration output that might be seen if you want to enable an FTP client that had been disabled.

FTP CLIENT Configuration
Service is not enabled.
Service is stopped.

FTP CLIENT configuration options:
1 - Enable service on this node
2 - Enable & Start service on this node
[E] - Exit FTP_CLIENT configuration

Enter configuration option: 2
In this example, as with the previous one, the TCP/IP Services software has already been started, so you have the choice of starting the client as well as enabling it. If you choose option 1, the FTP service is enabled and FTP starts the next time TCP/IP Services is started. If you choose option 2, the FTP service is started immediately and then every time the TCP/IP Services is started.

If the TCP/IP Services software is not already started, then the FTP Client Components Configuration menu gives you only the option of enabling the component, as in the following example:

1 - Enable service on this node
[E] - Exit FTP_CLIENT configuration
Configuring TCP/IP Services
3.3 Running TCPIP$CONFIG

After you configure the client component environment, press Return or choose option E to exit from the Client Components menu. If you chose option A from the Main Configuration menu to configure all the TCP/IP Services components, the Server Components Configuration menu displays next; otherwise, the procedure returns to the the Main Configuration menu.

3.3.6 Configuring the Server Environment

To display the Server Components Configuration menu, choose option 3 (Server components) from the Main Configuration menu. If you chose option A from the Main Configuration menu to configure all the TCP/IP Services components, the Server Components Configuration menu displays automatically after you finish configuring the client components.

Compaq TCP/IP Services for OpenVMS Server Components Configuration Menu

A - Configure options 1 - 21
[E] - Exit menu

Enter configuration option:

Components are enabled if they have been added to the TCP/IP Services configuration database (TCPIP$CONFIGURATION.DAT), and they are started the next time TCP/IP Services is started. You can also start (or stop) a specific component, without having to restart TCP/IP Services, by choosing the "Start service" option from that component's configuration menu. In addition, you can use command procedures to start or stop a specific component, as explained in Section 3.10.3.

The initial status of the components depends on whether you have other TCP/IP Services installations in place on the system, and whether the software or individual components have been started. To minimize resource consumption, enable and start the specific server components you plan to use, and disable those you do not plan to use. You can choose option A to configure all the server components.

For server components that have associated client components (such as the FTP server and client), when you configure the server component you are prompted about whether to configure the corresponding client component.

__Note__

TELNET and RLOGIN are enabled from the client menu. If you want to disable the TELNET or RLOGIN server, then you must disable the service. To enable or disable the TELNET server or the RLOGIN server, use the Client Components Configuration menu, choose the appropriate
client, and disable and stop the service by choosing the "Disable & Stop
service on this node" option.

The following is an example of an XDM server configuration output. The
configuration displays for other server components might vary.

Enter configuration option: 21 [Return]

XDM Configuration
Service is defined in the SYSUAP.
Service is not defined in the TCPIP$SERVICE database.
Service is not enabled.
Service is stopped.

XDM configuration options:
1 - Enable service on this node
[E] - Exit XDM configuration

Enter configuration option:

Note
XDM requires the following DECwindows components to be installed:
• SYS$COMMON:[SYSLIB]DECW$XLIBSHR.EXE
• SYS$COMMON:[SYSLIB]DECW$XTLIBSHR5.EXE
• SYS$COMMON:[SYSLIB]DECW$TRANSPORT_COMMON.EXE (VAX
only)

The TCPIP$CONFIG procedure checks whether these components are
installed. If they are not found, TCPIP$CONFIG notifies you and gives
you the option of configuring XDM and installing the DECwindows
components later before you attempt to activate XDM. The notification
and prompt are as follows:

XDM requires DECwindows components that are not installed.
Attempts to activate XDM will fail.
Type C to continue with XDM configuration, or E to exit [ E ]:

After you configure the server components, press Return or choose option E to
exit from the Server Components Configuration menu. If you chose option A from
the Main Configuration menu to configure all the TCP/IP Services components,
the Optional Components Configuration menu displays next; otherwise, the
procedure returns to the Main Configuration menu.

3.3.7 Configuring the Optional Components
You may need to configure optional product components if you plan to do one or
more of the following:
• Run the PATHWORKS for OpenVMS (Advanced Server), the Advanced Server
for OpenVMS, or DECnet over TCP/IP software.
• Run or develop applications that use the Stanford Research Institute's (SRI)
QIO application programming interface (API).
• Allow Anonymous FTP access.
Configuring TCP/IP Services
3.3 Running TCPIP$CONFIG

- Initialize Kerberos authentication for the TELNET server.

To display the Optional Components Configuration menu, choose option 4 (Optional components) from the Main Configuration menu. If you chose option A from the Main Configuration menu to configure all the TCP/IP Services components, the Optional Components Configuration menu displays automatically after you finish configuring the server components.

The Optional Components Configuration menu displays the following menu options:

Compaq TCP/IP Services for OpenVMS Optional Components Configuration Menu

Configuration options:
1 - Configure PWIP Driver (for DECnet-Plus and PATHWORKS)
2 - Configure SRI QIO Interface (INET Driver)
3 - Set up Anonymous FTP Account and Directories
4 - Configure Kerberos Applications
A - Configure options 1 - 3
[E] - Exit menu

Enter configuration option:
Choose the options that are appropriate for your system: the PWIP Driver, the SRI QIO Interface, Anonymous FTP Accounts and Directories, or Kerberos authentication for TELNET.

- If you want to run PATHWORKS for OpenVMS (Advanced Server), Advanced Server for OpenVMS, or DECnet over TCP/IP, configure the PWIP driver by choosing option 1. In addition, refer to the appropriate documentation for the layered product.

- If you run or develop applications that use the SRI QIO API, choose option 2.

- If you want to allow Anonymous FTP access, choose option 3 to set up an Anonymous FTP account and directories. Make sure you obtain the necessary user information code (UIC) (see Section 1.2.8) and determine guest user privileges.

- If you want to provide the security benefits of Kerberos authentication for the TELNET server, choose option 4 to configure Kerberos. For details about configuring Kerberos support, see Section 3.3.7.1.

The following example shows the output for configuring the PWIP driver:

Enter configuration option: 1

TCPIP Transport for DECnet and Pathworks Service Configuration
Service is enabled on specific node.
Service is stopped.

TCPIP Transport for DECnet and Pathworks Service configuration options:
1 - Disable service on this node
[E] - Exit PWIP_DRIVER configuration

Enter configuration option:
3.3.7.1 Configuring and Enabling Kerberos Support

To configure the TELNET service to support Kerberos, follow these steps. For more details about Kerberos features, including prerequisites and instructions for using Kerberos, see the Compaq TCP/IP Services for OpenVMS Release Notes.

Note

Before you begin the following steps, make sure the TELNET service is stopped.

1. From the TCPIP$CONFIG.COM procedure Main Configuration menu, choose option 2 (Client components).
2. From the list of client components, choose option 6 (TELNET).
3. From the TELNET Configuration menu, choose option 1 (Enable service on all nodes). This step creates the TCPIP$TELNET user account and directory.
4. Return to the Main Configuration menu.
5. From the Main Configuration menu, choose option 4 (Optional components).
6. From the Optional Components Configuration menu, choose option 4 (Configure Kerberos Applications). The following menu is displayed:

Kerberos Applications Configuration Menu

TELNET Kerberos is not defined in the TCPIP$SERVICE database.

Configuration options:

1 - Add Kerberos for TELNET server
2 - Remove Kerberos for TELNET server
[E] - Exit menu

Enter configuration option:

7. From the Kerberos Applications Configuration menu, choose option 1 (Add Kerberos for TELNET Server).
8. Exit the command procedure.
9. When you are prompted to start the TELNET service, enter N.
10. Start the TELNET service by executing the TELNET startup procedure, as shown in the following example:

$ @SYS$STARTUP:TCPIP$TELNET_STARTUP.COM
%TCPIP-I-INFO, image SYSSYSTEM:TCPPIP$TELNET_SERVER.EXE installed
%TCPIP-I-INFO, image SYSSYSTEM:TCPPIP$TELNET.EXE installed
%TCPIP-I-INFO, logical names created
%TCPIP-I-INFO, telnet service enabled
%TCPIP-I-INFO, telnet (kerberos) service enabled
%TCPIP-S-STARTDONE, TCPIP$TELNET startup completed

The information message confirms that the TELNET Kerberos service has been enabled.
3.4 Using TCPIP$CONFIG Option Commands to Bypass TCPIP$CONFIG Menus

If you are an experienced TCP/IP Services user, you may want to bypass the configuration menus to enable or disable functionality, as follows:

1. Log in to the SYSTEM account.
2. Run the TCPIP$CONFIG command procedure and include appropriate options and keywords in the command line, as shown:

```
@SYS$MANAGER:TCPIP$CONFIG [option] {DISABLE | ENABLE} [CLUSTER]
```

In this format, option can be one of the options described in the following table. The table also describes the function of the DISABLE, ENABLE, and CLUSTER keywords.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>Configures the core environment and all client and server components.</td>
</tr>
<tr>
<td>CLIENT</td>
<td>Configures all client components and related software.</td>
</tr>
<tr>
<td>MINIMUM</td>
<td>Configures the domain, Internet interfaces, Rlogin client, FTP client, FTP server, TELNET client, and TELNET server. Prompts you for optional components.</td>
</tr>
<tr>
<td>SERVER</td>
<td>Configures all server components and related software.</td>
</tr>
<tr>
<td>WORKSTATION</td>
<td>Configures the BIND resolver, the domain, dynamic routing, Internet interfaces, time zone, remote login, remote shell, remote executive, FTP client, FTP server, TELNET client, TELNET server, and SMTP.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLUSTER</td>
<td>Configures all specified components clusterwide (except for the BIND server and SMTP, which you cannot configure clusterwide).</td>
</tr>
<tr>
<td>ENABLE</td>
<td>Enables the specified components.</td>
</tr>
<tr>
<td>DISABLE</td>
<td>Disables the specified components.</td>
</tr>
</tbody>
</table>

For example, the following command enables the client components for the entire cluster:

```
$ @SYS$MANAGER:TCPIP$CONFIG CLIENT ENABLE CLUSTER
```

**Note**

The procedure implements two levels of enabling and disabling: clusterwide and single node (except for SMTP, which is configured and enabled as node specific only).
3.5 Making Configuration Changes Take Effect

Whenever you configure the core TCP/IP Services software (the core environment), you must then start (or restart) TCP/IP Services to make the changes take effect. Do this before you run tests or customize the environment. Start TCP/IP Services from TCPIP$CONFIG by following the procedure described in Section 3.7.

If you made changes to the client, server, or optional components only (that is, not to the core environment), you do not have to restart TCP/IP Services; to initialize the changes, you can restart the affected components individually by choosing the “Start service” option in the affected component’s configuration menu. Alternatively, you can use each component’s startup command procedure, as described in Section 3.10.3.

You can have the TCP/IP Services software started automatically each time the OpenVMS operating system is rebooted, or you can restart the software manually, as explained in Section 3.10.

3.6 Stopping TCP/IP Services Using TCPIP$CONFIG

Stop TCP/IP Services on your system by choosing option 5 (Shutdown Compaq TCP/IP Services for OpenVMS) from the Main Configuration menu, as in the following example:

Compaq TCP/IP Services for OpenVMS Configuration Menu

Configuration options:

1 - Core environment
2 - Client components
3 - Server components
4 - Optional components
5 - Shutdown Compaq TCP/IP Services for OpenVMS
6 - Startup Compaq TCP/IP Services for OpenVMS
7 - Run tests
A - Configure options 1 - 4
[B] - Exit Configuration procedure

Enter configuration option: 5
Begin Shutdown...
%TCPIP-I-INFO, TCP/IP Services shutdown beginning at  5-MAR-2002  
15:26:14.39
%TCPIP-S-SHUTDONE, TCPIP$FINGER shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$FTP_CLIENT shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$FTP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$IMAP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$LBROKER shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$LOCKD shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$LPD_CLIENT shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$LPD shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$METRIC shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$NFS_CLIENT shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$NFS shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$NCFS shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$NTP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$PCNFS shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$POP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$PORTMAPPER shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$PROXY shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$PWIP_DRIVER shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$RExec shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$RLOGIN shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$RMshutdown completed
%TCPIP-S-SHUTDONE, TCPIP$RMT shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$RSH shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$SMTP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$SNMP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$STATD shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$TELNETSYM shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$TELNET shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$TFTP shutdown completed
%TCPIP-S-SHUTDONE, TCPIP$XDM shutdown completed
%TCPIP-S-SHUTDONE, TCP/IP Kernel shutdown completed
%TCPIP-S-SHUTDONE, TCP/IP Services shutdown completed at  5-MAR-2002  
15:26:17.78

Shutdown request completed.

3.7 Starting TCP/IP Services Using TCPIP$CONFIG

After configuring the core environment, start TCP/IP Services on your system by choosing option 6 (Startup Compaq TCP/IP Services for OpenVMS) from the Main Configuration menu, as in the following example:

Compaq TCP/IP Services for OpenVMS Configuration Menu

  Configuration options:
  1 - Core environment
  2 - Client components
  3 - Server components
  4 - Optional components
  5 - Shutdown Compaq TCP/IP Services for OpenVMS
  6 - Startup Compaq TCP/IP Services for OpenVMS
  7 - Run tests
  A - Configure options 1 - 4
  [E] - Exit configuration procedure
Enter configuration option: 6
Begin Startup...

%TCPIP-I-INFO, TCP/IP Services startup beginning at 5-MAR-2002
15:27:08.34
%TCPIP-I-NORMAL, timezone information verified
%RUN-S-PROC_ID, identification of created process is 00000D42
%TCPIP-I-SETLOCAL, setting domain and/or local host
%TCPIP-I-STARTCOMM, starting communication
%TCPIP-I-SETPROTP, setting protocol parameters
%TCPIP-I-DEFINE, defining interfaces
%TCPIP-I-STARTNAME, starting name service
%TCPIP-S-STARTDONE, TCP/IP Kernel startup completed
%TCPIP-I-PROXYLOADED, loaded 0 NFS proxy records
%TCPIP-I-LOADSEERV, loading TCPIP server proxy information
%TCPIP-I-SERVLOADED, auxiliary server loaded with 0 proxy records
-TCP/IP-I-SERVSkip, skipped 0 communication proxy records
-TCP/IP-I-SERVTOTAL, total of 0 proxy records read
%TCPIP-S-STARTDONE, TCPIP$PROXY startup completed
%TCPIP-S-STARTDONE, TCPIP$PORTMAPPER startup completed
%TCPIP-S-STARTDONE, TCPIP$FINGER startup completed
%TCPIP-S-STARTDONE, TCPIP$FTP startup completed
%TCPIP-S-STARTDONE, TCPIP$FTP_CLIENT startup completed
%TCPIP-S-STARTDONE, TCPIP$IMAP startup completed
%TCPIP-S-STARTDONE, TCPIP$LBROKER startup completed
%TCPIP-S-STARTDONE, TCPIP$LOCKD startup completed
%TCPIP-S-STARTDONE, TCPIP$LPD startup completed
%TCPIP-S-STARTDONE, TCPIP$LPD_CLIENT startup completed
%TCPIP-S-STARTDONE, TCPIP$MTP startup completed
%TCPIP-S-STARTDONE, TCPIP$NFS_CLIENT startup completed
%TCPIP-S-STARTDONE, TCPIP$NFS startup completed
%TCPIP-S-STARTDONE, TCPIP$OShey startup completed
%TCPIP-S-STARTDONE, TCPIP$PCNFS startup completed
%TCPIP-S-STARTDONE, TCPIP$POP startup completed
%TCPIP-S-STARTDONE, TCPIP$PWIP_DRIVER startup completed
%TCPIP-S-STARTDONE, TCPIP$RMT startup completed
%TCPIP-S-STARTDONE, TCPIP$RSH startup completed
%TCPIP-S-STARTDONE, TCPIP$SMTP startup completed
%TCPIP-S-STARTDONE, TCPIP$SNMP startup completed
%TCPIP-S-STARTDONE, TCPIP$STATD startup completed
%TCPIP-S-STARTDONE, TCPIP$TELENET startup completed
%TCPIP-S-STARTDONE, TCPIP$TELNETSYM startup completed
%TCPIP-S-STARTDONE, TCPIP$TFTP startup completed
%TCPIP-S-STARTDONE, TCPIP$XDM startup completed
%TCPIP-S-STARTDONE, TCP/IP Services startup completed at 5-MAR-2002
15:27:50.47
Startup request completed.
Press Return to continue ...

3.8 Verifying the Configuration

You can verify the configuration by running the installation verification procedure (IVP).

You should run the IVP if any of the following apply:

- You loaded the Product Authorization Key (PAK), and you want to verify that the lower-layer software and the Portmapper service are installed correctly.
- You did not load the PAK, but you want to verify that TCP/IP Services is installed correctly for DECwindows to display the TCP/IP Services applications.
Configuring TCP/IP Services

3.8 Verifying the Configuration

- You require the software to transfer device socket packets that continuously vary in size between a sender and a receiver.
- You need to test the Portmapper service with a pair of client/server programs. The IVP reports the time it took to run the test to SYS$OUTPUT.
- You need to test your SNMP service.

Before you run the IVP, make sure TCP/IP Services has started and you have SYSPRV, OPER, NETMBX, and TMPMBX privileges.

You can run the IVP from the TCPIP$CONFIG configuration procedure or by command line at the OpenVMS DCL prompt. When you run the IVP from TCPIP$CONFIG, you have the option of running an additional test that verifies the SNMP configuration.

3.8.1 Running the IVP from the TCPIP$CONFIG Command Procedure

In the TCP/IP Services for OpenVMS Main Configuration menu, choose option 7 (Run tests). The Test menu appears, as in the following example:

Compaq TCP/IP Services for OpenVMS TEST Menu

Test options:

1 - Internet IVP
2 - SNMP IVP
A - Tests 1 - 2
[E] - Exit menu

Enter test option:

Choose the appropriate option for the test you want to perform.

3.8.2 Running the IVP from the OpenVMS DCL Prompt

To run the IVP at the DCL prompt, any time after exiting the configuration procedure, enter the following command. This procedure performs the same test as option 1 (Internet IVP) of the TCPIP$CONFIG Test menu.

$ @SYS$TEST:TCPIP$IVP

3.8.3 Verifying the TCP/IP Services Internet Configuration

When you choose either option 1 or option A from the TCPIP$CONFIG Test menu, or run the TCPIP$IVP command procedure at the command line, the IVP tests the basic TCP/IP Services software configuration, as in the following example. Here, the test completes successfully.

Enter test option: 1[Return]

%%% TCP/IP IVP: started %%%

UDP/IP test started at 5-MAR-2002 16:13:03.02
UDP/IP test ended at 5-MAR-2002 16:13:03.69
UDP/IP transferred successfully in 0 seconds 4198400 bytes

TCP/IP test started at 5-MAR-2002 16:13:41.21
TCP/IP test ended at 5-MAR-2002 16:13:41.21
TCP/IP transferred successfully in 37 seconds 4198400 bytes

RAW_IP test started at 5-MAR-2002 16:13:41.71
RAW_IP test ended at 5-MAR-2002 16:13:41.79
RAW_IP transferred successfully in 0 seconds 251000 bytes
If the IVP does not complete successfully, the procedure displays error messages. All IVP errors use the same format as OpenVMS system messages. For example:

```
%TCPIP-E-IDENT, explanation of error.
```

Table 3-2 lists some common problems that cause IVP error messages. If the recommended action does not correct the problem, contact your Compaq support representative.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network configuration is incorrect.</td>
<td>Shut down TCP/IP Services and rerun the configuration procedure.</td>
</tr>
<tr>
<td>Startup fails.</td>
<td>Check the system parameters in the MODPARAMS.DAT file and adjust them if necessary. (See Section 1.2.7.) Then shut down and restart TCP/IP Services.</td>
</tr>
<tr>
<td>Installation kit is defective.</td>
<td>Request a replacement kit.</td>
</tr>
<tr>
<td>IVP fails because the PAK is missing.</td>
<td>Register a Compaq TCP/IP Services for OpenVMS PAK.</td>
</tr>
</tbody>
</table>

### 3.8.4 Verifying the SNMP Configuration

If you choose either option 2 or option A from the TCPIP$CONFIG Test menu, the IVP tests the SNMP service, as in the following example:

Begin SNMP IVP...

The SNMP IVP requires that TCP/IP Services be running.

It performs the following startups and shutdowns on the SNMP service only (other TCP/IP services are not affected):

- If SNMP is running, shuts down SNMP before initial configuration
- Starts SNMP and runs tests
- Shuts down SNMP and restores initial configuration
- Before exiting, starts SNMP

Shutting down the SNMP service... done.

Creating temporary read/write community SNMP7IVP_6520.

Enabling SET operations.

Starting up the SNMP service... done.

    Saving sysContact: Ralph Nickleby
    Setting sysContact to: Julius Caesar
    Retrieved sysContact: Julius Caesar
    (Retrieved value matches SET value.)
    Restoring sysContact to: Ralph Nickleby

    Saving snmpEnableAuthenTraps: 1 (enabled)
    Setting snmpEnableAuthenTraps to: 2 (disabled)
    Retrieved snmpEnableAuthenTraps: 2 (disabled)
    (Retrieved value matches SET value.)
    Restoring snmpEnableAuthenTraps: 1 (enabled)

Disabling SET operations.
3.8 Verifying the Configuration

Deleting temporary read/write community SNMPIVP_6520.
Shutting down and restarting the SNMP service...
Shutting down the SNMP service... done.
Starting up the SNMP service... done.
SNMP IVP request completed.
Press Return to continue ...

If one of the SNMP tests fails, you will see messages such as the following:

SNMPIVP: unexpected text in response to SNMP request:
"No reply."
See file SYS$SYSDEVICE:[TCPIP$SNMP]TCPIP$SNMP_REQUEST.DAT for more
details.
Verify that SNMP trace is not enabled.
sysContact could not be retrieved. Status = 0
The SNMP IVP has NOT completed successfully.

In this case, the error could indicate that not all SNMP components have started,
or that SNMP tracing is enabled and needs to be disabled. For information about
SNMP trace, see the Compaq TCP/IP Services for OpenVMS Management guide.

3.9 Additional Configuration Tasks

After you run TCPIP$CONFIG and enable the functionality and components
appropriate for your network, you need to complete additional configuration tasks
to enable access to product applications. TCP/IP Services provides a management
command interface and logical names you can use to modify or customize the
software for your environment.

The additional configuration tasks include:

• Populating databases (for example, for BIND and DHCP)
• Setting up user accounts
• Setting up communication and NFS proxies
• Defining print queues
• Setting up, exporting, and maintaining file systems
• Tuning the system for optimum performance

Many of the services require additional configuration or optimization. For more
information about how to configure each service, refer to the Compaq TCP/IP
Services for OpenVMS Management guide.

3.10 Starting and Stopping TCP/IP Services by Command

You can use commands in your OpenVMS startup file to have TCP/IP Services
started and stopped automatically when the OpenVMS system starts up or shuts
down, as explained in Section 3.10.1. These commands start and stop all the
TCP/IP Services components installed on your system. Alternatively, you can
start and stop individual TCP/IP Services client or server components without
affecting other TCP/IP Services components currently running. For information
about starting and stopping individual components, see Section 3.10.3.

If necessary, you can start and stop TCP/IP Services manually, as explained in
Section 3.10.2. You can also start and stop user-written services, as explained in
Section 3.10.4.
3.10 Starting and Stopping TCP/IP Services by Command

3.10.1 Automatically Starting and Stopping TCP/IP Services

To allow TCP/IP Services software to start automatically when the system starts up, and to stop automatically when the system shuts down, edit the SYS$COMMON:[SYSMGR]SYSTARTUP_VMS.COM file and include the following command:

@SYS$STARTUP:TCPIP$STARTUP

If your system had earlier versions of TCP/IP Services, UCX$STARTUP.COM and UCX$SHUTDOWN.COM files might be present. These are no longer applicable; delete any definition of them from SYS$MANAGER:SYSTARTUP_VMS.COM.

If you want TCP/IP Services to start after you log in to your OpenVMS account, the OpenVMS systemwide login procedure (typically SYS$MANAGER:SYLOGIN.COM) must have world read and execute protections (W:RE).

To display the current protections, enter the following command:

$ DIR/PROTECTION SYS$MANAGER:SYLOGIN.COM

For information about protections, refer to the OpenVMS documentation.

3.10.2 Starting and Stopping TCP/IP Services Manually

To start TCP/IP Services manually, enter the following command:

$ @SYS$STARTUP:TCPIP$STARTUP

To stop TCP/IP Services manually, enter the following command:

$ @SYS$STARTUP:TCPIP$SHUTDOWN

3.10.3 Starting and Stopping Individual Services

On a system already running TCP/IP Services, you can configure an individual server or client component without affecting the other TCP/IP Services components running on your system and without having to restart TCP/IP Services.

Most services can be shut down and started independently. This is useful when you change parameters or logical names that require the service to be restarted.

The following files are provided:

- SYS$STARTUP:TCPIP$service_STARTUP.COM allows you to start the service.
- SYS$STARTUP:TCPIP$service_SHUTDOWN.COM allows you to shut down the service.

To preserve site-specific parameter settings and commands, create the following files. These files are not overwritten when you reinstall TCP/IP Services:

- SYS$STARTUP:TCPIP$service_SYSTARTUP.COM can be used as a repository for site-specific definitions and parameters to be invoked when service is started.
- SYS$STARTUP:TCPIP$service_SYSHUTDOWN.COM can be used as a repository for site-specific definitions and parameters to be invoked when service is shut down.

In these file names, service is the name of the service to be started or shut down. For example, use TCPIP$NTP_SHUTDOWN to shut down the NTP service.
For more information, see the Compaq TCP/IP Services for OpenVMS Management guide.

### 3.10.4 Starting and Stopping User-Written Services

TCP/IP Services supplies command procedures for starting and stopping user-written services. To start a user-written service, enter the following command:

```bash
$ SYS$STARTUP:TCPIP$CUSTOMER_SERVICE_STARTUP service-name
```

For `service-name`, specify the name of the service as defined using the TCP/IP management command `SET SERVICE`.

To stop the user-written service, enter the following command:

```bash
$ SYS$STARTUP:TCPIP$CUSTOMER_SERVICE_SHUTDOWN service-name
```

### 3.11 Specifying TCP/IP Services as the Transport for DECwindows Applications

To enable TCP/IP Services as the transport interface for DECwindows applications, add the following line to the `SYS$MANAGER:DECW$PRIVATE_SERVER_SETUP.COM` command procedure:

```bash
$ DECW$SERVER_TRANSPORTS == "DECNET,LOCAL,TCPIP"
```

Then restart DECwindows:

```bash
$ @SYS$STARTUP:DECW$STARTUP RESTART
```

If DECN or DECN-Plus software runs on the system, start it.

To display DECwindows applications from a DECwindows client (remote host) to a DECwindows server (your workstation), proceed as follows:

1. Set up security on the remote host.
2. Add the remote client to the local hosts database.
3. Add to `SYS$MANAGER:DECW$PRIVATE_SERVER_SETUP.COM` the following line:
   ```bash
   $ DECW$SERVER_TRANSPORTS == "DECNET,LOCAL,TCPIP"
   ```
4. Set the display for the applications to the remote host:
   ```bash
   $ SET DISPLAY/CREATE/NODE=remote-host/TRANSPORT=TCPIP
   ```
A

Sample New TCP/IP Services Installation and Configuration

This appendix shows a sample installation and configuration of the TCP/IP Services product on a system on which the product has never been installed.

A.1 Sample New Installation Procedure

The following example shows a sample installation dialog for the TCP/IP Services. In this example, the installation takes place on a system where the product has not been installed. If TCP/IP Services had been installed previously on the system, the installation dialog would differ slightly (see Chapter 2).

Note

The symbols xx in the following example represent the product’s two-digit update version number.

Choose one or more items from the menu separated by commas: 1

The following product has been selected:
  DECVAXVMS TCPIP V5.3-xx Layered Product

Do you want to continue? [YES]

Configuration phase starting ...

You will be asked to choose options, if any, for each selected product and for any products that may be installed to satisfy software dependency requirements.

DEC VAXVMS TCPIP V5.3-xx: Compaq TCP/IP Services for OpenVMS.

Copyright 2002 Compaq Information Technologies Group, L.P

Compaq Computer Corporation

Compaq TCP/IP Services for OpenVMS offers several license options.

Do you want the defaults for all options? [YES]

Do you want to review the options? [NO]

Execution phase starting ...

The following product will be installed to destination:
  DECVAXVMS TCPIP V5.3-xx DISK$OVMSVAXSYS:[VMS$COMMON.]

%TCPIP-W-PCSI_INSTALL

% - Execute SYSSMANAGER:TCPIP$CONFIG.COM to proceed with configuration of
% Compaq TCP/IP Services.
Sample New TCP/IP Services Installation and Configuration

A.1 Sample New Installation Procedure

Portion done: 100%

The following product has been installed:
DEC VAXVMS TCPIP V5.3-xx Layered Product
DEC VAXVMS TCPIP T5.3-xx: Compaq TCP/IP Services for OpenVMS.

Check the release notes for current status of the product.

A.2 Sample New Configuration Procedure

The following example shows a sample configuration dialog for the TCP/IP Services, in which the following components are configured:

- Core environment
- TELNET client
- FTP server

In this example, the configuration takes place on a system where the product has never been configured. If TCP/IP Services had been configured previously on the system, the dialog would differ significantly (see Chapter 3).

TCP/IP Network Configuration Procedure

This procedure helps you define the parameters required to run Compaq TCP/IP Services for OpenVMS on this system.

Checking TCP/IP Services for OpenVMS configuration database files.

Enter broadcast mask for hearts [10.0.2.255]: 255.0.1.255

* Is the above correct [YES]:

End of configuration questions for Internet interface WE0

DYNAMIC ROUTING Configuration

Dynamic routing has not been configured.

You may configure dynamic ROUTED or GATED routing.

You cannot enable both at the same time. If you want to change from one to the other, you must disable the current routing first, then enable the desired routing.

If you enable dynamic ROUTED routing, this host will use the Routing Information Protocol (RIP) - Version 1 to listen for all dynamic routing information coming from other hosts to update its internal routing tables.

It will also supply its own Internet addresses to routing requests made from remote hosts.
If you enable dynamic GATED routing, you will be able to configure this host to use any combination of the following routing protocols to exchange dynamic routing information with other hosts on the network:
- Routing Information Protocol (RIP) - Version 1 & 2
- Router Discovery Protocol (RDISC)
- Open Shortest Path First (OSPF)
- Exterior Gateway Protocol (EGP)
- Border Gateway Protocol (BGP-4)
- Static routes

* Do you want to configure dynamic ROUTED or GATED routing [NO]: [Return] A default route has not been configured.

Enter your Default Gateway host name or address: GATE1.BUDGET.ACME.COM
gate1.budget.acme.com is not in the local host database.

Enter Internet address for gate1.budget.acme.com: 10.0.2.66

BIND RESOLVER Configuration

A BIND resolver has not been configured.

Compaq TCP/IP Services for OpenVMS supports the Berkeley Internet Name Domain (BIND) resolver. BIND is a network service that enables clients to name resources or objects and share information with other objects on the network.

Before configuring your system as a BIND resolver, you should first be sure that there is at least one system on the network configured as either a BIND primary or secondary server for this domain.

You can specify a BIND server by its address or name; however, if specified by name, an entry for it must exist in the TCPIP$HOST database.

You will be asked one question for each server. Press Return at the prompt to terminate the list.

Enter Internet address for numb9.budget.acme.com: 10.0.2.11

Creating file TCPIP$ETC:IPNODES.DAT
Creating file TCPIP$ETC:SERVICES.DAT

TCPIP uses timezone information provided by the OpenVMS Operating System. No additional timezone configuration is needed for TCPIP when the operating system is configured correctly.

This section verifies the current OpenVMS timezone configuration. A warning message (TCPIP-W-) indicates that corrective action should be taken. TCPIP will appear to operate but components may display either the wrong time or a time inconsistent with other applications.

%TCPIP-I-INFO, Logical name SYS$TIMEZONE_RULE found.
%TCPIP-I-INFO, Software for automatic Summer/Winter time (TDF) change
%TCPIP-I-INFO, is present.
%TCPIP-I-INFO, Further action to ensure TDF change is not necessary.

%TCPIP-I-NORMAL, timezone information verified
